Dynamic Analysis: Testing

John Businge john.businge@unlv.edu

Introduction

- Dynamic Analysis verifies properties of a system during execution/runtime.
- Testing Analysis is one example of Dynamic Analysis
 - Unit tests, integration tests, system tests, and acceptance tests use dynamic testing

Testing in the Book

- Tests are your life insurance! (OORP, p. 149)
- Tests are essential to assuring the quality of refactoring/code change activities.
- Write Tests to Enable Evolution (OORP, p.153)
 - Good tests can find bugs in your artifact
 - Tests can also detect unwanted behavior
- You can also write tests to understand a part of a system (OORP, p.179)
- Test the Interface, Not the implementation (OORP, p.171). This is essentially Black-box testing.

Unit Testing

- In this session, we focus on Unit Testing.
 - Unit testing focuses on the smallest testable parts of an application called units (e.g., a class method or function)
- There are other types of testing (Integration, Performance, Security, etc.)
- It does not mean that Unit Testing is more important, but those are the tests we can more easily automatize and benefit from tool support.

Quality of a Test Suite

- How do you know if your unit test cases are good enough?
- Are they really testing the application?
- When do we stop testing?

Solution: Test Coverage!

Test Coverage

Coverage =
$$\frac{Number\ of\ Covered\ Items}{Total\ number\ of\ items}\ X\ 100\%$$

- Examples:
 - Statement (Line, or Code) Coverage.
 - Branch (Condition) Coverage
 - Path Caverage
 - Mutation Caverage

Example: a function to test

```
int foo(int input, bool b1, bool b2, bool b3){
   int x = input;
   int y = 0;
   if(b1)
      x++;
   if(b2)
      x--;
   if(b3)
      y=x;
   return y;
```

Statement/Line/Code Coverage

```
Test Case(s)
      ASSERT foo(0, true, true, true) == 0;
int foo(int input, bool b1, bool b2, bool b3) {
   int x = input;
   int y = 0;
   if(b1)
      x++;
   if(b2)
      x--;
   if(b3)
      y=x;
   return y;
```

Statement/Line/Code Coverage

```
Test Case(s)
     ASSERT foo(0, true, true, true) == 0;
int foo(int input, bool b1, bool b2, bool b3) {
   int x = input;
   int y = 0;
   if(b1)
      x++;
   if(b2)
               100% Statement Coverage
      x--;
   if(b3)
      y=x;
   return y;
```

Statement/Line/Code Coverage

```
Test Case(s)
     ASSERT foo(0, false, true, true) == -1;
int foo(int input, bool b1, bool b2, bool b3) {
   int x = input;
   int y = 0;
                    \frac{8}{9} x100% = 88.9%
    if(b1)
     x++;
    if (b2)
                100% Statement Coverage
      x--;
    if(b3)
       y=x;
    return y;
```

Branch/Condition Coverage

```
Test Case(s)
     ASSERT foo(0, true, true, true) == 0;
int foo(int input, bool b1, bool b2, bool b3) {
   int x = input;
   int y = 0;
   if(b1)
      x++;
   if(b2)
               50% Branch Coverage
      x--;
   if(b3)
      y=x;
   return y;
```

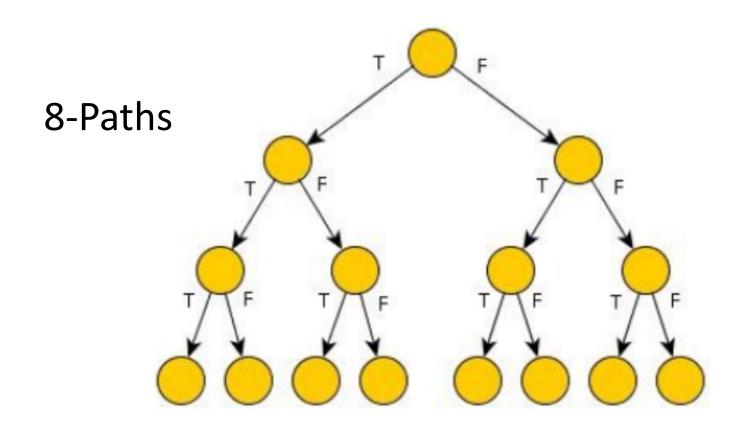

Branch/Condition Coverage

```
Test Case(s)
     ASSERT foo(0, true, true, true) == 0;
     Assert foo(0, false, false, false) == 0;
int foo(int input, bool b1, bool b2, bool b3) {
   int x = input;
   int y = 0;
   if (b1)
      x++;
   if(b2)
               100% Branch Coverage
      x--;
   if(b3)
      y=x;
   return y;
```

New Test

Path Coverage

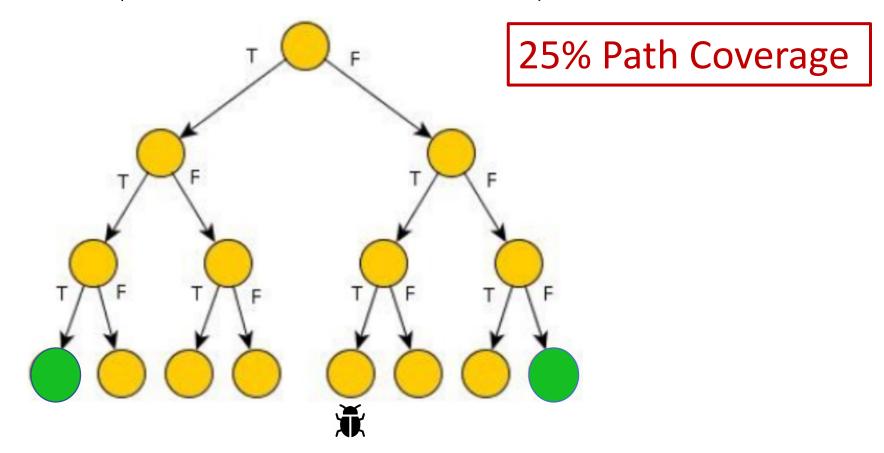

Paths for three "if" each can be either true (T) or false (F)

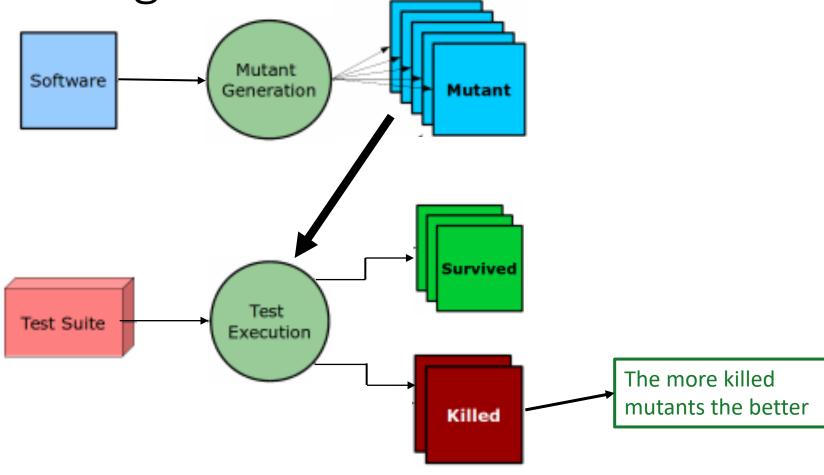

Path Coverage

```
Test Case(s)
```

```
ASSERT foo(0, true, true, true) == 0;
ASSERT foo(0, false, false, false) == 0;
```

Mutation Testing

Mutation Coverage =
$$\frac{Number\ of\ Killed\ Mutants}{Total\ number\ of\ Mutants}\ X\ 100\%$$

Mutation Testing: Small Example

Original

```
int f(bool a, bool b) {
  if(a && b) return 1;
  else return 0;
}
```

Test Case

```
void testf() {
   assert f(true, true) == 1;
   assert f(false, false) == 0;
}
```

Mutant

```
int f(bool a, bool b) {
  if(a || b) return 1;
  else return 0;
}
```

Mutant Survives the Test Case

Mutation Testing: Small Example

Original

```
int f(bool a, bool b) {
  if(a && b) return 1;
  else return 0;
}
```

Test Case

```
void testf() {
   assert f(true, true) == 1;
   assert f(false, false) == 0;
}
```

Mutant

```
int f(bool a, bool b) {
  if(a || b) return 1;
  else return 0;
}
```

Missing Assertions that Could Kill this Mutant

```
assert f(false, true) == 0;
assert f(true, false) == 0;
```

Mutation Coverage

 Assess how good your test cases are at catching faults by introducing defects into the source code.

More reliable metric to validate test suite effectiveness.

 In recent years, mutation testing has been more prominent in academia and less in industry.

Testing Coverage for the Project

- It is required to show coverage for your Project (in both the Intermediate and the Final Report)
 - At least Statement Coverage, but Branch Coverage is better.
 - You should show the chosen coverage before the refactoring/change and after (where hopefully you also added new tests).
- There is no set coverage limit to reach for the project.
- But if your project has very low coverage, you better have a good explanation for that.
- Focus on increasing the coverage for the system parts that will be affected by your refactoring/change.
